Problema 5. Ondas sobre cuendas

$$y = 0.08 (m) sen(0.24 \times -30 t)$$
 con x e y en (m)
t en (seg)

Determinar:

a) Velocidad de la onda

La onda progresiva dada so de la forma
$$y(x,t) = A \operatorname{sen}(kx-wt)$$

$$uon \quad A = 0.08 \, m \quad (Amplitud)$$

$$k = n^{\circ} \operatorname{de onda} = 0.24 \left(\frac{Lud}{m}\right) = \frac{2\pi}{\lambda}$$

$$w = frecueucia angular = 30 (\frac{rad}{seg}) = 2\pi f$$

$$w = \frac{\text{Espacio}}{\text{trempo}} = \frac{\lambda}{T} \quad \text{la distancia de una}$$

$$k = \frac{2\pi}{\lambda} \Rightarrow \lambda = \frac{2\pi}{k} = \frac{2\pi}{0.24} = \frac{26.2(m)}{10.24} \quad \text{ls recovida en un}$$

$$w = 2\pi \int \Rightarrow f = \frac{30}{2\pi} = \frac{30}{2\pi} = \frac{4.8(42)}{10.24} \quad \text{periodo T con } T = \frac{1}{4}$$

$$w = \lambda \cdot f = \frac{2\pi}{k} \cdot \frac{w}{2\pi} = \frac{30}{0.24} = \frac{30}{0.24} = \frac{30}{0.24} = \frac{125}{125} \frac{w/s_p}{s_p}$$

b) Vilocidad transversal maxima

$$T = \frac{1}{4} = \frac{1}{418} = 0,21(seg).$$
